## DESCRIPTION

Morganite Silicon Carbide Crucibles, Clay Graphite Crucibles and IsoPressed Crucibles are of superior quality as they undergo the most stringent quality-control test at our R&D laboratory. The manufacturing plants at Aurangabad and Mehsana have the most modern processing facilities with state-of-the-art technology based on environment-friendly resin bonding / clay bonding and a quality system established as per international standards with an ISO 9001:2008 certification. Manufactured from carefully selected flake graphite and silicon carbide and bonded with resin, our silicon carbide crucibles offer the following advantages:

## ADVANTAGES OF RESIN BONDED SILICON CARBIDE CRUCIBLES

### HIGH RESISTANCE TO THERMAL SHOCK

Crucibles, in use, are often subjected to the stresses created by rapid and/or uneven changes of temperatures, which in extreme cases, can lead to premature failure.

Outstanding resistance to thermal shock is imparted to our crucibles as the heat is distributed quickly throughout the crucible, by usage of selective grades of flake graphite and silicon carbide.

### HIGH RESISTANCE TO EROSION

The flow of molten metal and charging the crucible with solid metal leads to abrasion and erosion of the inside wall. The high proportion of silicon carbide in our crucibles imparts better strength, greater hardness, and high resistance to erosion.

### HIGH RESISTANCE TO CHEMICAL ATTACK BY FLUXES AND SLAGS

Though graphite is chemically inert and resistant to corrosive chemicals, the bond is often susceptible to chemical attack by fluxes and slags. Our crucibles made of chemically inactive graphite, silicon carbide and carbon, resist attack by the alkaline fluxes used for light alloys; the oxidising/reducing fluxes used for copper alloys and the corrosive slags formed from them.

## HIGH RESISTANCE TO ATMOSPHERIC OXIDATION

Graphite oxidises progressively in air as the temperature is raised. Most crucibles have an external glaze to prevent this. As no external glaze is perfect by itself, invariably oxidation of graphite occurs, leading to loss of thermal conductivity and reduction in strength of the crucible. To provide extra resistance to oxidation, we have protective agents incorporated in the body in addition to the external glaze.

## CONSTANT MELTING SPEED

The superior oxidation resistance of our crucibles ensures that they retain a constant melting speed to the end of their long life. More heats per day means more output, but equally important is the consistency of output which enables the foundrymen to schedule their productive more effectively.

## FUEL ECONOMY

The amount of fuel needed to melt, in an ordinary crucible increases steadily as the crucible oxidises and loses speed. The consistent high melting speed of our crucibles makes for substantial fuel saving in comparison to other crucibles.

## LOWER METAL LOSS

The amount of metal lost by oxidation during the melting process is proportional to the time taken to melt and cast the charge. Our crucibles, with their higher than average melting speed, reduce the overall melting time to a minimum and consequently make an essential contribution for reducing metal losses.

 **MorganMMS**

## HANDLING CRUCIBLES

- Always handle crucibles with care.
- Damage to glaze could adversely affect its performance.
- Never roll a crucible on a hard floor.

## STORING CRUCIBLES

- Store crucibles in a warm, dry place.
- Stand crucibles on pallets, never directly on the floor.
- Never stack crucibles inside one another.
- When stacking crucibles, separate the layers with hardboard.

## EXAMINATION OF THE FURNACE

- Before installing the crucible and stand in the furnace, check the condition of the refractory lining and make any necessary repairs.
- Remove any loose debris from the bottom of the furnace chamber.
- Ensure that the drain hole is clear and that the drain hole flap can move freely.
- In electric resistance furnaces check the condition of elements. Because of the risk of oxidation in electric resistance furnaces it is particularly important to eliminate the entry of air into the furnace chamber. The drain hole should be sealed with a thin zinc plate and all other apertures made air tight.

## INSTALLING THE CRUCIBLE

- The use of a stand made of the same material will help to ensure uniform heating of the base of the crucible and so reduce thermal strains.
- The stand should have the same diameter as the base of the crucible in order to provide adequate support.
- For optimum heat transfer and melting efficiency:
- The height of the stand should be such that the base of the Crucible is on level with the centre line of the burner.
- The stand and crucible should be installed centrally in the furnace.

## LIFT OUT FURNACES

- Sprinkle a thin layer of coke or other carbonaceous material on top of the stand to prevent the crucible from sticking to it.
- Always place the crucible centrally on the stand.
- Rocking and levering to free a crucible which has stuck to the stand can cause fractures in the lower wall of the crucible.

## BALE OUT FURNACES

- Set the top cover bricks to leave a gap of 8 mm around the crucible to allow for expansion of the crucible and the furnace lining. Too small a gap can lead to cracking at the top of the crucible.
- Place a layer of insulating material, such as ceramic fibre over the top of the lining and the top edge of the crucible in order to insulate the metal top plate. Do not push the insulating material down between the cover bricks and the crucible.
- If the steel top ring is fitted, ensure that there is a gap of 12 mm between it and the inside of the crucible to allow for expansion. Too small a gap can lead to cracking at the top of the crucible.

## TLTING FURNACES

- Set the stand on the metal stand in the recess at the base of the furnace. Ensure that it is firm, central and level.
- Spread cement evenly over the top of the stand excluding the spigot.
- Place the crucible centrally on to the stand.
- Cement the key/grip bricks on to their support bricks in the furnace lining, leaving 6-10 mm gap between crucible and key bricks.
- Insert cardboard or carbonaceous material in the gap.
- Place key bricks 75 mm below the top edge of the crucible.
- Leave a gap of about 40 mm below the spout, to avoid the crucible hanging up on the spout.

## CHARGING

- As soon as the crucible becomes red hot all over, charge and melt immediately .
- Charge the crucible in a vertical position.
- Charge light scrap first to form a cushion for a heavier metal to follow.
- Use tongs to charge ingots.
- Place ingots and large pieces vertically.
- Do not pack the metal tightly in the crucible.

## CRUCIBLE WARM UP PROCEDURE

- Crucible should be preheated empty.
- Do not charge ingot or scrap until the crucible is red hot.
- The burner flame should be controlled to ensure the crucible is brought up to red heat (950m C) as per the Heating Recommendations.

## MELTING AND POURING

- Melt as quickly as possible.
- Avoid overheating the melt.
- Always melt to the lowest possible temperature compatible with the casting.
- Avoid stewing the molten metal for long periods.
- Avoid delay between heats and use the crucible for as many melts a day as possible.

MORGANITE CRUCIBLE (INDIA) LTD

B-11, MIDC, Waluj, Aurangabad - 431 136, Maharashtra, INDIA. Tel. (0240) 2554405, 2554406 • Fax. (0240) 2564554 • [www.morganmms.com](http://www.morganmms.com)  
DIAMOND CRUCIBLE COMPANY LTD

## FLUX ADDITIONS

Ensure that the correct flux is used for:

- The alloy being treated.
- Temperature of the alloy.
- Use minimum quantity of flux to satisfy metallurgical requirements.
- Any unnecessary increase in melt temperature will result in accentuated attack on the crucible with a drastic reduction in crucible life.

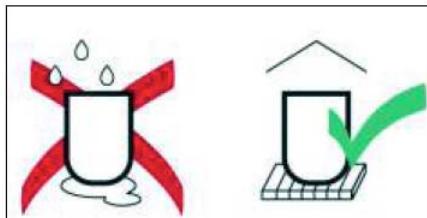

## CLEANING OUT

- Crucibles should be cleaned out by careful scraping when the crucible is red hot.
- Slag left in the crucible leads to rapid thinning of crucible wall in subsequent melts.
- Dross/Oxide left in the crucible leads to longer melt times, higher fuel consumption and shorter crucible life in subsequent melting.

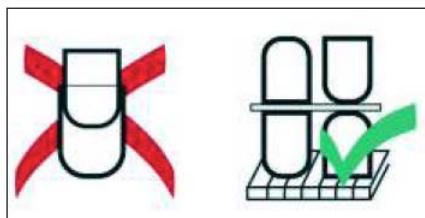

## Recommendations for care and use of crucibles.

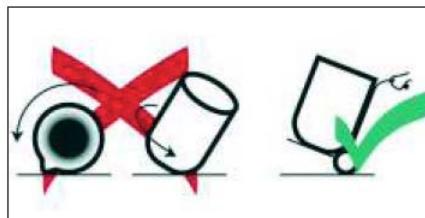

The following practices should be observed in order to achieve the maximum possible crucible life. If any further advice or information is required, please contact our sales or technical staff.

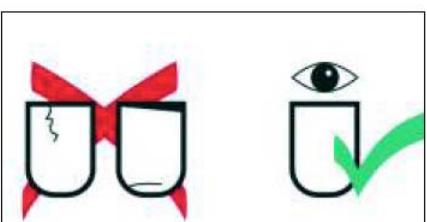

Store crucibles off the floor in a dry, warm place.

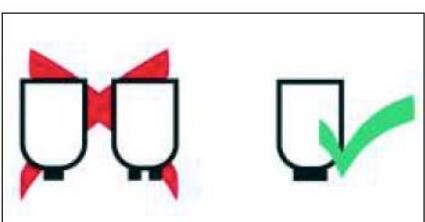

Do not nest one inside another. Separate layers with hardboard.

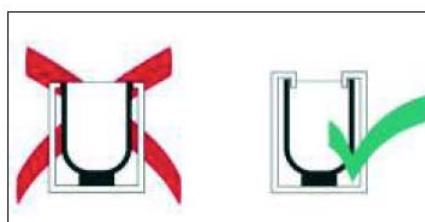

Do not roll crucibles. Move using a sack truck with padding.

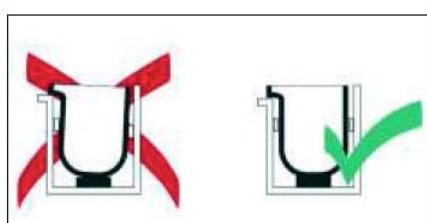

Check thoroughly for cracks or damage before use.

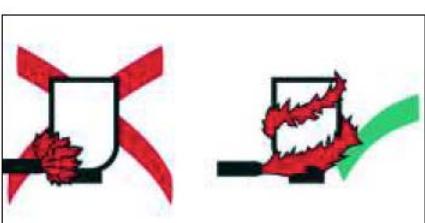

Use the correct crucible stand which must be central and support the whole base.

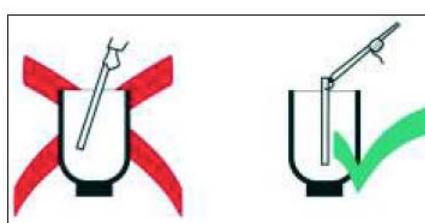

Allow space for expansion between crucible and furnace lining/cover.

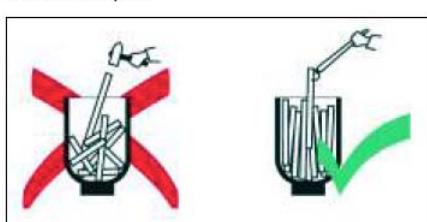

Use correctly positioned grip bricks in tilting furnaces, leaving gaps for expansion. Do not hang crucible on spout.

The flame path must be tangential to the crucible.

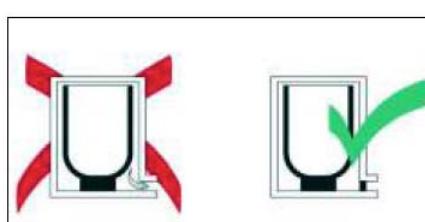

Ingots should be loaded carefully into the crucible using tongs.

First charge with light returns, as a cushion, then add ingots vertically.

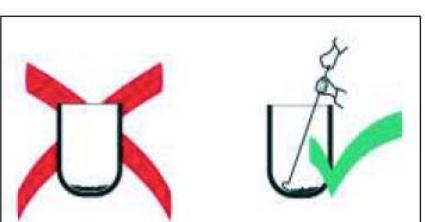

Only add flux after the metal is molten.

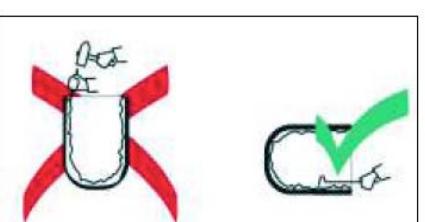

Avoid ingress of cold air by ensuring that the drain hole is sealed.

Lift-out tongs should hold crucible on its lower third and fit evenly on both sides.

The crucible must be emptied before switching off the furnace.

The crucible should be cleaned out carefully every day while still red hot.

## HEATING RECOMMENDATIONS FOR SILICON CARBIDE CRUCIBLES (SUPREX)

After installation in the furnace, the crucible should be heated up slowly to a temperature of 200°C (392°F) over a period of 2 hours, to eliminate any moisture that may be present. Afterwards, Silicon Carbide crucibles should be heated up to a temperature of 950°C (1742°F) on full power, if possible. Silicon Carbide crucibles used in a melting operation can be continuously heated up on full power until working temperature is reached. The crucible is then ready to be charged with care.

When using Silicon Carbide crucibles for holding, the temperature of 950°C (1742°F) should be reached and held for approximately 1 hour. This ensures even melting of the glaze with the additional anti-oxidation coating, which is essential to achieve the maximum possible crucible life. For holding crucibles this procedure should be carried out periodically, but always before starting up again after a cool down period. This helps to compensate for the negative effects of low holding temperatures.

Each time the crucible is heated up after a cooling down phase, it should be heated following the procedure laid down for the first installation. However, the drying time of 2 hours can be omitted. Should the Silicon Carbide crucible not be used for a longer period, it will be necessary to eliminate moisture, which may have been absorbed from slag. In this case, the crucible should be heated up to a temperature of 200°C (392°F). After reaching this temperature, further heating should be continued as per the first installation.

The above recommendations refer to the use of new crucibles in existing furnaces. When installing a new Silicon Carbide crucible into a new furnace, the heating and drying instructions of the furnace manufacturer should be followed. If the furnace manufacturer prescribes a longer heating cycle (or curve), this procedure should be carried out without the crucible installed. It is essential that the crucible is installed in an absolutely dry furnace.

## HEATING RECOMMENDATIONS FOR CLAY/GRAFITE CRUCIBLES (SALAMANDER, ALPHA, SIGMA)

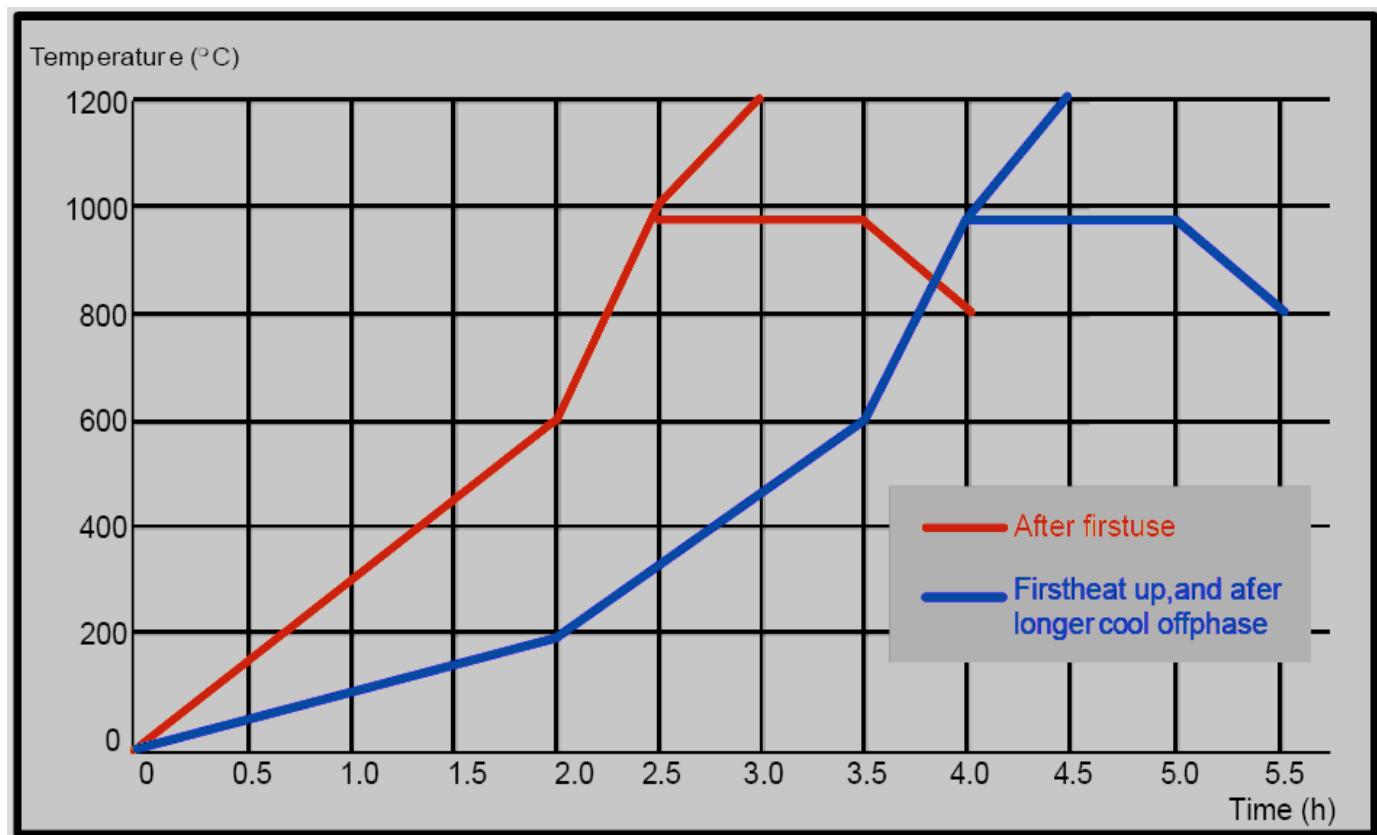

After installation in the furnace, the crucible should be heated up slowly to a temperature of 200°C (392°F) over a period of 2 hours, to eliminate any moisture that may be present.

Afterwards, Clay/Graphite crucibles should be heated up to a temperature of 600°C (1112°F) on low power, before the full heating rate is used to reach 950°C (1742°F), or the desired working temperature, if higher.

When using Clay/Graphite crucibles for holding, the temperature of 950°C (1742°F) should be reached and held for approximately 1 hour. This ensures even melting of the glaze with the additional anti-oxidation coating, which is essential to achieve the maximum possible crucible life. For holding crucibles this procedure should be carried out periodically, but always before starting up again after a cool down period. This helps to compensate for the negative effects of low holding temperatures.

Each time the crucible is heated up after a cooling down phase, it should be heated following the procedure laid down for the first installation. However, the drying time of 2 hours can be omitted. Should the Clay/Graphite crucible not be used for a longer period, it will be necessary to eliminate moisture which may have been absorbed from slag. In this case, the crucible should be heated up to a temperature of 200°C (392°F). After reaching this temperature, further heating should be continued as per the first installation.

The above recommendations refer to the use of new crucibles in existing furnaces. When installing a new Clay/Graphite crucible into a new furnace, the heating and drying instructions of the furnace manufacturer should be followed. If the furnace manufacturer prescribes a longer heating cycle (or curve), this procedure should be carried out without the crucible installed. It is essential that the crucible is installed in an absolutely dry furnace.

SYMPTOM	CAUSE
1. Vertical cracks	
a. Vertical cracks anywhere, crucible wall very thin the crack and the crucible generally showing of wear.	1a. This indicates that the crucible has worn out and has cracked owing to thinning and loss of strength.
b. Vertical crack in chine, extending across the bottom. Crucible may be nearly new or unworn.	1b. This type of failure is due to excessively rapid heating of the chine when the crucible is cold and is known as "stunting". It is caused by putting a cold crucible into a hot fire or by warming up a cold crucible too fast. The condition is often accompanied by glaze flaking due to the thermal shock.
c. Vertical crack from the top edge.	1c. This failure can also be caused by rapid heating, especially when the bottom and chine of the crucible are heated much faster than the top. A "wedge" near the top edge can also cause this failure. Similarly, badly fitting tongs or a knock on the edge may cause some mechanical damage or distortion should be visible
d. Vertical crack in wall not extending to the top or bottom.	1d. This is usually due to pressure from the inside that may be caused by the charge wedging into the crucible when cold, and subsequently expanding as it heats up. Cracks due to "wedging" in this manner are usually wider on the outside than on the inside and the edges of the cracks may show a "step" as if one section of the pot has been forced outwards.
2. Lateral cracks	
a. Near bottom — possibly resulting in the bottom coming off.	2a. This may be due to mechanical damage, such as an ingot being dropped in, or a blow from a poker. It may also be caused by thermal strains as in (1b).
b. Just about half way up in a "rapid" crucible.	2b. This failure may be caused by the crucible being stuck to its stand or fixed up in a bed of clinker. If the crucible is then gripped up rather high in the tongs and pulled hard by a crane or levered about to free it, it may part just below the tongs.
c. In spouted TP Crucibles, a lateral crack below the spout.	2c. This may be caused by bad crucible setting in the furnace. If fire clay is packed tightly under the spout when a new crucible is set, any subsequent contraction of the crucible will leave it suspended by its spout, causing the crack.

SYMPTOM	CAUSE
3. Star cracks	
a. In the base of the crucible.	3a. Due to thermal strains as in (1b).
b. In the side wall of crucible	3b. Due to wedging as in (1d). Usually shows bulging.
4. Holes in crucible	
a. A large hole in a crucible that has not worn thin...	4a. Almost invariably due to a heavy blow, as from throwing in an ingot. In such a case, the piece knocked out is usually much smaller on the side which was hit than on the other side.
b. Pinholes	4b. Usually these are actually leaks on a crack. Break up and look for crack.
c. Crucible worn thin	4c. Worn-out
5. Excessive wear or erosion	
a. Inside at metal level.	5a. Caused by flux or metal oxides floating on the metal. Avoid excessive oxidation or flux addition and avoid "stewing" and overheating, do not add flux too soon.
b. Inside all over	5b. Due to corrosive charge, such as Ferro chrome, or by flux added at the bottom of the crucible before charging metal. Can be minimised by avoiding overheating and stewing
. c. At the bottom and chine, outside in coke fired furnaces.	5c. This is caused by attack of coke, ash and slag, due to poor coke and/or overheating and/or standing it on a hard floor when lumps of coke have stuck to the bottom.
d. Outside, in pits and craters.	5d. Due to attack fluid or flux which has soaked through the crucible and attacked on the outside which is hotter
6. Miscellaneous	
a. Crocodile cracks outside	6a. A network of cracks, like crocodile skin, are caused by perishing.
b. Slow melting.	6b. Also caused by perishing
c. Flaking of glaze.	6c. This may be caused by thermal shocks as 1(b), the usual cause is putting a cold pot into a hot furnace.
d. Bottom bulged upwards and cracked.	6d. Due to setting the crucible down on a hard floor when a piece of coke or other material has stuck to bottom
e. Bottom cracking when there is a thick dross layer inside	6e. Due to expansion of the dross.
f. Green colouration outside crucible accompanied by softening.	6f. This is the result of long exposure to a high temperature over 1460°C.
g. Places detached from bottom or chine of new pot.	6g. Due to "bumping" of a damp pot.
h. Stunting	6h. Occurs due to differential expansion between any parts of the pot at excessively different temperatures. Do not subject the crucible to: rapid heating or uneven temperature distribution
i. Oxidizing	6i. When crucible is subjected to an oxidizing atmosphere at temperature between 600°C and 900°C.

- Spout length is measured from the outside of the crucible**
- Standard Spout length is 146 mm**

## Notes

- The dimensions shown are nominal and subject to normal manufacturing tolerances.
- Our crucibles are recommended for non-ferrous alloys except those containing more than 30% of Nickel, Chromium or Iron.
- Spout with length upto 280 mm is available**
- Any Basic model of AC and BC series can be converted to spouted model.**
- Working capacities are based on Brass Specific Gravity 8.35 and Aluminium Specific Gravity 2.7 and 90% of Brimful Capacity approx.

## ISOSTATIC PRESSING TECHNOLOGY (CIP) is used to produce high quality crucibles... "RED DIAMOND" SIGMA.

### CIP – A HOST OF HIGH-TECH ADVANTAGES

#### HOMOGENEITY

In CIP, an equal amount of pressure is applied simultaneously in all directions on the ceramic batch encased in the elastomeric mould. Since behaviour of the ceramic powder is directly related to the number of directions from which the pressure is applied, this process makes an optimal level of homogeneity possible. This makes CIP ideal for the manufacture of metal pouring refractories.

#### SWIFT TRANSFER

High Resistance: In CIP, the ceramic powder is contained in a flexible mould which is immersed in a liquid kept at very high pressures. This helps to compact the ceramic powder uniformly in all directions. This high compactness allows a steady and fast pace of heat transfer and electrical resistance.

#### HIGH & UNIFORM DENSITY

Because of equal and high pressure, the ceramic powder can be compacted at a very high and uniform density throughout the required shape. Isostatic Pressing is the benchmark process in the world's most technologically advanced regions.

*The range of special features offered by CIP are:*

- > Homogenous High Density and Strength
- > High Thermal Conductivity
- > High Fuel Efficiency & Energy Saving
- > Virtually Zero Defects

## TROUBLE FREE PYROMETRY

### THE COST EFFECTIVE THERMOCOUPLE PROTECTION SYSTEM

The HotRod™ thermocouple sheath range offers a premium thermocouple protection system – providing excellent service life, good accuracy and response.

Supplied ready for use with a threaded 1/2" steel tube for rapid attachment to the furnace pyrometry system.

Includes removable plastic netting protection to minimise glaze damage in transit.

#### Benefits:

- > Reduced fuel consumption
- > Less down-time
- > Less cost
- > No tools needed for attachment

## HOTROD™
